

PROJECT NAME: Air Emission Permits - Synthetic Minor Source

PROJECT DESCRIPTION:

Environmental Information Services, Inc. (EIS) was responsible for assisting the client with air permitting services and the application for a synthetic minor source permit. The steps involved include identifying each source of emissions, identifying chemicals that contribute to emissions, calculating emissions based on material use and balances. Once these steps had been completed, a determination was made concerning the permit status and the need for modifications. Other factors that contribute to the permit status decision were practical emissions limitations and alternative operating scenarios. The data was organized and applications for permits prepared for the client.
