

**PROJECT NAME:            Allowable Treatment Report for Reactive Materials**

**PROJECT DESCRIPTION:**

EIS produced and wrote a report on allowable treatment for reactive materials. The purpose of the report was to examine the regulatory question of whether polyurethane precursors, isocyanates mixed with polyols, diols, extenders, pigments, and other additives may be treated by the generator by reaction in containers in a 90-day storage facility without a US EPA permit.

The report included a review of polyurethane chemistry, regulatory background, definition of a reactive waste, encapsulation of EPA regulations, and a conclusion. The report included a copy of all cited references.
